While your panel array might be 19kW, the inverter could be either less or more than this size. Normally it is bad to have a much larger inverter than panels. It is usually good to have an inverter that is less than the array size. A 19kW solar array can be put with an inverter with an AC output of 14.25kW. What you "can" do is not what you ...

Inverter sizing. In many systems, the inverter is sized to be smaller than the panel output. For example, a 6.6 kW solar system is often paired with a 5 kW inverter. Because the panels are only rarely generating at their full rated capacity, this can be a good way to get the best value from the inverter and often makes good economic sense.

The linked article goes into more detail, but in short - you get huge bang for buck by putting on 33% more panels than an inverter is rated for. This is why 6.6kW solar systems, using 5 kW inverters, are still very popular in 2025 - they represent a sizing "sweet spot" providing value for money while being small enough to fit on nearly ...

Number of panels = DC rating / Panel Rating (e.g. 250 W) *note this is important b/c panels are rated in watts, and the systems are rated in kilowatts (1000 watts). So a 7.53 kW system = 7530 Watts and a 250 watt panel = .250 kW. example: 7.53 kW x 1000 / 250 watt = 30.12 panels, so roughly 30 250 panels (30 x 250W = 7500 Watts = 7.5 kW)
