This can be done either with a 48V battery or 2 24V batteries in series. If you need even more power than 1920W, then, with 48V usually being the upper limit to the voltage used, then it makes sense to invest in thicker, expensive, high current capacity cables. With a cable that can carry 80A (4 AWG cable), you have capacity for 3840W.

3. We can therefore conclude that for the same amount of power, current flowing through a conductor will be halved in a 24V vs 12V electrical system. This allows to use smaller cables for the same amount of voltage drop. As a real-world example, Victron's Multiplus 3000VA inverter (Amazon | BayMarineSupply | Data Sheet) will draw half the current when running on ...
