You may try to increase the power dissipation. Then, for example, for 0.5A current draw you can reverse-solve the equations I gave before and get a power dissipation of $(72V - 12V) * 0.5A = 30W$. Even a linear regulator won't suite you here, since 60V drop is just humongous (I think I've never even seen one that could handle such a high voltage).
