Are sodium-ion batteries the future of energy storage?

The growth of renewable energies over the last decade has created a surging demand for better energy storage solutions. While lithium-ion (Li-ion) technology remains the forerunner in the battery space, sodium-ion batteries are emerging as a promising alternative, especially in applications in which cost is a key criterion.

Are sodium ion batteries a good alternative to Li-ion?

Sodium-ion batteries are a cost-effective alternative to Li-ion batteries, using sodium instead of lithium. However, these batteries have low energy density (about 140-160 Wh/kg). Yet, Rota noted, "This lower density of sodium-ion is less of an issue in energy storage systems, where space is not as constrained--in particular on solar plants."

Are sodium batteries a good choice for energy storage?

Much of the attraction to sodium (Na) batteries as candidates for large-scale energy storage stems from the fact that as the sixth most abundant element in the Earth's crust and the fourth most abundant element in the ocean, it is an inexpensive and globally accessible commodity.

What are the advantages of sodium ion batteries?

Key advantages include the use of widely available and inexpensive raw materials and a rapidly scalable technology based around existing lithium-ion production methods. These properties make sodium-ion batteries especially important in meeting global demand for carbon-neutral energy storage solutions.

What is a Technology Strategy assessment on sodium batteries?

This technology strategy assessment on sodium batteries, released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) 2030 strategic initiative.

Are sodium-ion batteries a viable option for stationary storage applications?

Sodium-ion batteries (NIBs) are attractive prospects for stationary storage applications where lifetime operational cost, not weight or volume, is the overriding factor. Recent improvements in performance, particularly in energy density, mean NIBs are reaching the level necessary to justify the exploration of commercial scale-up.

The project represents the first phase of the Datang Hubei Sodium Ion New Energy Storage Power Station, which consists of 42 battery energy storage containers and 21 sets of boost converters.

Sineng Electric's 50 MW / 100 MWh sodium-ion battery energy storage system project in China's Hubei province is the first phase of a larger plan that will eventually reach 100 MW / 200 MWh. The initial capacity has already been connected to the grid and can power around 12,000 households for an entire day.

Sodium-ion has theoretical advantages that could make it complementary to lithium-ion in the battery market, if not a direct competitor. The energy density of most types of lithium battery tends to be much higher than that of its newer counterparts, but on the flipside, sodium-ion batteries could be produced much more cheaply.

The energy storage station is the first phase of a 200-MWh project and consists of 42 battery bays. It can store 100,000 kWh of electricity on a single charge, releasing power during peak periods to meet the needs of about 12,000 households for a day and reducing CO2 emissions by 13,000 tons per year, according to Hina Battery.

The project is China's first 100-MWh-scale energy storage power station to utilize sodium-ion batteries. Developed and managed by Datang Hubei Energy Development, the project can store 100,000 kWh of electricity on a single charge, supplying power to approximately 12,000 households for an entire day.
