Just think about it, a 50 MW solar park consists of approximately 170 thousand photovoltaic panels and each panel consists of 60-72 cells. Measuring the performance of the panels is a very serious challenge, however, if the poorer performing solar panel can be localized, it has a momentous added value in terms of operation in the long run.

Monocrystalline panels are easy to distinguish by the black color of the cells. Their efficiency today varies from 16 to 22%, which means that mono solar cells convert into direct current from 16% to 22% of the sunlight that they receive. That's the most popular type of panels -- in fact, most top manufacturers don't even sell anything else.
