

Can a 60v inverter be connected to 72v

Which inverter do I need for a 12V system?

To connect an inverter to your battery bank, match the battery bank voltage with an inverter that can handle that same voltage. For a 12V system, you need a 12V inverter. Standard Pure Sine Wave inverters simply change DC power to AC power.

How does a 12V to 120V inverter work?

Dave Orton on the Sprinter Forum pioneered the use of a 12v to 120v inverter to take 12v power from the running engine and turn it into 120v, then send that 120v power to wherever the house battery is placed. The 120v runs a charger (or runs through an inverter) to recharge the house battery. Why would you do this? The inefficiencies are crazy.

What type of inverter does a 48V system require?

Simply put, if you have a 12V system, you need a 12V inverter; a 48V system requires a 48V inverter. Standard Pure Sine Wave inverters simply change DC power to AC power. Inverter Chargers handle this function plus allow you to charge your batteries off shore power or a generator.

Do I need a 60Hz inverter?

Here in the US, things run at 60Hz, in Europe and most other places around the world, things run at 50Hz. You'll most likely require a 60Hz inverter if you are running a device intended to run on US power. We like to go camping and travel quite frequently.

Can a 60v battery be overcharged?

Either way, you really have to keep an eye on your voltages during running, as the low voltage cutoff will be wrong, and you can over discharge your battery. A 60v lead acid battery will be around 72v when fully charged, so the controller has to be made for at least this much. Usually there is a little headroom in the ratings also.

Can a 60V controller run at 72 volts?

In general 100V is a common spec for caps and FETs, so at 72 volts you have ~30V of headroom. However some parts are rated at 80V so be careful. Overall the risk is low but not zero. I've been running my generic 60v controller at 20s without problems, but it has 100v capacitors.

There was 2 white wires coming out of the controller but they were NEVER connected together. Either way, this new controller should show me what the bike can really do! That brings up a question.

My experience is those type motors can handle a lot more than 1000w, 48v 20 amps controller. But about 3000w is the practical upper limit. At that point, you can and will melt the halls at least, if not the whole motor. But the motor can still stand it for a limited time. like about 30 min, or ten miles at full speed.

The inverter will run other heavy loads. 1200w for the EF AC. 1400w for space heater. Etc. I've also expiremented with a Handy Power X 1500w inverter, but it has a low overvoltage protection and my Traverse seems to output near 15 volts with no load, making it a challenge to use.
