The electrochemical energy storage/conversion devices mainly include three categories: batteries, fuel cells and supercapacitors. Among these energy storage systems, supercapacitors have received great attentions in recent years because of many merits such as strong cycle stability and high power density than fuel cells and batteries [6,7].

Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.
