Electrolytic capacitors types for power supplies come and go. They attend different demands than stages interface or other more subtle applications. Some are large and recommended for main raw filtering, usually before regulators. Some are small and have to take care of smaller currents. Raw...

AC capacitors are also utilized in power factor correction circuits where they supply leading reactive power (KVAR) to correct the lagging current caused by inductive loads. The circuit is said to be running at unity power factor if the capacitive reactance of the applied capacitors exactly matches the inductive reactance of the load. $PF = KW / KVA$

Any regulated power supply needs to be designed to have low noise at the input and output to the regulator section. Getting noise low relies on selecting the right filter capacitor for your supply. Depending on the current, these capacitors can be quite large, or you may need to place a large number of capacitors in parallel.

As the capacitor is directly connected to the power supply, very high demands are made on its reliability. It is therefore recommended that only X2 capacitors compliant with UL and ENEC are used for capacitive power supplies. For this purpose, TDK offers a wide range of EPCOS X2 capacitors such as the new B3292*H/J* series. To

the power supply. At any frequency over 20 kHz, the impedance looks like 10 ohms. Another commonly encountered load is the step load. The equivalent frequency of a step is $0.35 / \text{rise time}$. If a 100 mA step load with a rise time of 1 microsecond were impressed on the power supply, the power supply would

This type of power supply uses the capacitive reactance of a capacitor to reduce the mains voltage to a lower voltage to power the electronics circuit. The circuit is a combination of a voltage dropping circuit, a full-wave bridge rectifier circuit, a voltage regulator circuit, and a power indicator circuit.
