A flywheel device contains a rotary flywheel that spins at speeds of 37,000 RPM, converting electrical energy into stored kinetic energy. In a UPS application, if a power outage occurs, the flywheel converts the kinetic energy into DC power and sends it to the UPS, which supplies it to the facility as AC power.

The integrated flywheel energy storage at the core of our products makes them inherently reliable, delivering predictable, consistent backup power. The normal state of CleanSource Uninterruptible Power Supply is with the flywheel spinning constantly, storing kinetic energy. When called upon during a utility outage, the flywheel is ready to ...

Flywheel energy storage, also known as kinetic energy storage, is a form of mechanical energy storage that is a suitable to achieve the smooth operation of machines and to provide high power and energy density flywheels, kinetic energy is transferred in and out of the flywheel with an electric machine acting as a motor or generator depending on the ...

Flywheel energy storage represents a cutting-edge technology leveraging kinetic energy to facilitate electricity storage and supply. Through the acceleration of a rotor within a vacuum, flywheels maintain energy in the form of rotational kinetic energy.

Efficient storage of energy The flywheel works through a heavy cylinder that is kept floating in vacuum containers by the use of a magnetic field. By adding power to it - e.g. energy from a wind turbine - the flywheel is pushed into motion. As long as the wheel is rotating, it stores the energy that initially started it.
