started with the grid connected inverter design. To regulate the output current, for example, the current feeds into the grid; voltages and currents must be sensed from the inverter. Sigma delta-based sensing provides easy isolation and superior sensing of these signals. Many C2000 MCUs have sigma-delta modulators to sense these parameters from the

One more disadvantage with this configuration is an enlargement of the PV plant is tedious. The central inverters connected to a grid-connected system are actually rated at full power. To eliminate a full power inverter, an extra storage system is to be embedded in a system such as ultra-capacitor.

Inverter cannot connect the PV strings whose positive and negative terminals need to be grounded. Do not connect any local load between the inverter and the AC circuit breaker. Inverter is applicable only to the grid-connected PV system. Any other usage is strictly forbidden. Figure 2-1 Inverter application in PV power system
