It also consumes less energy. An LV drive produces high frequency and better motor performance at low voltage, thus reducing production cost. On the downside, low voltage creates more current. If LV drives are used with high horsepower (HP) machines, it generates more heat and increases the room temperature. More current means more generated heat.

Inverter welders are a type of welding machine that uses an electronic circuit to convert the input AC power into a high-frequency AC current, which is then transformed into a low-voltage DC current for welding. This process allows the welder to control the output current precisely and adjust it according to the type and thickness of the metal being welded.
