Is a photovoltaic power station intelligent operation and maintenance system based on digital twin?

In this paper, we propose a photovoltaic power station intelligent operation and maintenance system based on digital twin. The mapping of real photovoltaic power station is constructed in virtual space to realize intelligent operation and maintenance of photovoltaic power station. We build a 3D scene model to simulate the real environment.

How a photovoltaic system is integrated with a utility grid?

A basic photovoltaic system integrated with utility grid is shown in Fig. 2. The PV array converts the solar energy to dc power, which is directly dependent on insolation. Blocking diode facilitates the array generated power to flow only towards the power conditioner.

How does a PV power station support grid voltage recovery?

According to the grid regulations, the PV power station is required to support the grid voltage recovery by injecting the reactive current. In addition, after the fault is cleared, the active power of the PV station should recover to the pre-fault value with a change rate of at least 0.3 pu/s.

Do photovoltaic systems have dynamic behaviours under different failure modes?

Abstract: With the increasing usage of photovoltaic (PV) generation systems, it is of great relevance to develop effective models to characterise the dynamic behaviours of actual PV systems under different failures and operation modes.

How many PV power units are in a solar power station?

This station consists of 65 PV power units, and the circuit topology of each PV power unit is of a single-stage centralised structure, as shown in Fig. 1. A number of PV panels were connected in series to form a PV group. Then, several PV groups were connected in parallel to a high-power inverter for power conversion.

Why do we need a dynamic model for photovoltaic systems?

With the increasing usage of photovoltaic (PV) generation systems, it is of great relevance to develop effective models to characterise the dynamic behaviours of actual PV systems under different failures and operation modes.

support without energy storage. PV generation reserve a part of the active power in accordance with the pre-defined power versus voltage curve. Based on the similarities of the synchronous generator power-angle characteristic curve and the PV array characteristic curve, PV voltage  $V_{pv}$  can be analogized to the power angle  $\delta$ .

According to the law of conservation of energy, the active power of the photovoltaic energy storage system

maintains a balance at any time, there are: (9) ?  $P = P_{load} + P_{grid} - P_{pv}$  In the formula:  $P$  is the active power value of the energy storage unit required in the process of coordinating the active power balance of the system;  $P$  ...

This article deals with the multimode operation of a photovoltaic (PV) array, a battery, the grid and the diesel generator (DG) set-based charging station (CS) for providing the continuous charging and uninterruptible supply to the household loads. In this CS, a single voltage source converter operates the CS in an islanded mode, the grid connected mode and ...

In generally, the fluctuation of water level has no influence on the normal operation of hydropower station [43], but the water level and outflow under different energy scenarios affect the operation mode of hydropower stations [44]. Therefore, this section discussed the influence of different energy scenarios on the water level and outflow.

Although the PV reliability issue was already identified three decades ago [9], reliability quantification of an entire PV generation station remains unresolved due to the complex nature of PV systems. The existing literature mostly focuses on reliability assessment for the power electronic components such as IGBT [10], capacitor [11] and inverter [12], [13], ...

With the proposed control system, each PV generator is able to regulate the voltage and frequency of the PV power plant, when operating in islanded mode. The proposed solution ensures any additional PV generator can operate in synchronism and also that the generators can operate in synchronism with the grid, once it is reestablished.

This article deals with the multimode operation of a photovoltaic (PV) array, a battery, the grid and the diesel generator (DG) set-based charging station (CS)

To simplify the test items and steps needed for parameter identification, an appropriate identification and modelling method for a PV generation system is proposed on the ...

Solar power is the conversion of sunlight into electricity, either directly using photovoltaic (PV), or indirectly using concentrated solar power (CSP). The research has been ...

In this paper, a typical scenarios segmentation method based on SOM clustering algorithm is proposed based on the historical power generation data of a PV power plant. ...
