How to design cylindrical Li-ion battery cells?

A generic overview of designing cylindrical Li-ion battery cells. Function 1: Two types of jelly roll designs can be distinguished: With tabs and tabless. Jelly rolls with tabs can be realized with a single tab (Design A) or several tabs in a multi-tab design (Design B).

What is a cylinder Li-ion battery?

Cylindrical Li-ion battery cells consist of (i) a jelly roll, a wound composite consisting of a cathode, an anode, and two separators, and (ii) a cell housing consisting of a can and a cap. Current and heat transport between the jelly roll and the cell housing is traditionally conducted by contacting elements called tabs.

How does a jelly roll work in a lithium ion battery?

The jelly roll is inserted into a cell housing and contacted on the anode and cathode sides. After electrolyte filling, the cell is sealed. Jelly rolls for cylindrical Li-ion battery cells differ in two basic designs: (1) With tabs (Design A and Design B) and tabless (Design C and Design D).
