Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($<10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

This study selects the ATCSR as the main economic optimization metric for the CCHP system with phase change energy storage. The ATCSR is characterized as the ratio of the annual total cost difference between the SP system and the phase change energy storage CCHP system to the annual total cost of the SP system, as stated in .

What is phase change energy storage CCHP system?

In the phase change energy storage CCHP system, energy consumption originates from natural gas and purchased electricity from the grid. Since the measurement units of electricity and natural gas are different, this study uses the primary energy conversion factor to uniformly convert natural gas and electricity into direct energy.
