What is a cylindrical lithium ion battery?

The most common type of cylindrical lithium-ion battery is the 18650 cell, named for its dimensions: 18 millimeters in diameter and 65 millimeters in length. While the 18650 cell is the most well-known, there are other cylindrical cell form factors, such as 26650 and 2170 cells, each with different dimensions and specifications.

What is a cylindrical battery?

A cylindrical cell consists of sheet-like anodes, separators, and cathodes that are sandwiched, rolled up, and packed into a cylinder-shaped can. This type is one of the first mass-produced types of batteries and is still very popular. These cells are suited for automated manufacturing. Another advantage is mechanical stability.

What is a prismatic cell in a lithium battery?

A prismatic cell is a type of lipo battery cell that is characterized by its rectangular or square shape. Unlike cylindrical cells, which are tubular, lithium prismatic cells have a flat and often stackable design.

Are cylindrical lithium batteries better than prismatic batteries?

If the internal pressure of a cylindrical lithium battery grows too high, most of the cells are designed to rupture - thus mitigating safety risks from situations like a fire or an explosion. None of this is to say that cylindrical lithium batteries are inherently "better" than their prismatic counterparts, or vice versa.
