

What is a micro inverter solar system?

They are about the size of an internet router and one is installed underneath each solar panel. The main advantage of a micro inverter solar system is that it can measure the generation of each panel independently, as opposed to managing all solar panels at once. What is the difference between micro inverters and string inverters?

Do micro inverters produce more solar power?

Theoretically, micro inverters should yield more solar power. This is because when solar panels operate in a 'string' with string inverters, the current is reduced to that of the lowest-producing panel in the system. Micro inverters, on the other hand, produce energy independently of their neighbouring solar panels.

What is a solar inverter?

An inverter takes the energy generated by solar panels and turns it into a useable form. There are a various inverters, including battery inverters, hybrid inverters, grid-tie and off-grid inverters. Micro inverters are installed on each panel, whereas string inverters use just one system for all panels.

What are the different types of solar inverters?

Typically however, most households will need to choose between two options - string inverters or micro inverters. A micro inverter is an inverter that is installed on solar panels to convert the direct current energy (DC) generated by the panels into alternating current (AC) electricity for use in the home.

Do I need a solar inverter?

If you have solar panels, or are looking to get them, you'll need an inverter no matter what. Whether you get a string inverter, micro inverter or another model of inverter depends on your preference and set up.
