What is an uninterruptible power supply (UPS)?

Introduction An uninterruptible power supply (UPS) is an electrical apparatus that provides a continuous, stable, and uninterrupted supply of power to critical loads. UPSs can supply power to an important load for a certain amount of time when faults occur with utility power, so the user has ample time to deal with it.

What is backup uninterruptible power supply?

15.1.3.1. Backup uninterruptible power supply Fig. 15.2 shows the structure of the backup UPS. The backup UPS directly supplies power to the load from the grid when the utility power is normal. At this time, the inverter of the UPS does not work, and the grid charges the battery if the battery is not fully charged.

When the control system detects the active circulating current and reactive circulating current in the parallel system, the increase in the inverter output voltage amplitude is calculated according to Eq. (15.40).

How does a static ups work?

In the early 1960s, a static UPS using a thyristor appeared, based on power electronics conversion and a battery as an energy storage component. When the mains power is cut off, the AC power source continues by the battery inverter to supply power to the load.
